Performance Analysis Report

*MT5 tells you what happened.
We tell you whether your edge is real.*

Report Generated: January 24, 2026 at 01:53 PM

Data Source: MT5

Currency: USD

Starting Balance: \$1,000.00 (from deposit before first trade)

Code Version: 9151c14

Trading Period: November 05, 2024 — June 17, 2025

Performance Metric	Value
Total Trades	90
Win Rate	57.78%
Profit Factor	1.51
Net Profit	\$138.60
Account-Level ROI (Broker Equity)	13.86%
Strategy ROI (Trade P&L ÷ Avg Capital)	13.25%
Average Trade	\$1.54
Best Trade	\$9.00
Worst Trade	\$-9.00

IMPORTANT DISCLAIMER:

This report is provided for informational and educational purposes only. It does not constitute financial advice, investment recommendations, or an offer to buy or sell any securities. Past performance does not guarantee future results.

All trading and investing involves substantial risk of loss. You should carefully consider whether trading is suitable for you in light of your circumstances, knowledge, and financial resources. The analysis herein is based solely on historical trade data and does not account for changing market conditions, execution quality, or psychological factors.

Statistical metrics are provided as analytical tools only. High historical returns do not ensure profitability going forward. You may lose some or all of your invested capital. Always conduct your own due diligence and consult with a licensed financial advisor before making investment decisions.

Executive Verdict

Edge	~ Inconclusive
Fragility	Low
Primary Concerns	Regime Sensitivity

Bottom Line

This strategy shows mixed results with low fragility. Results are inconclusive — more data or strategy refinement needed before live trading.

Statistical Note: Permutation test p-value = 0.066 (≥ 0.05). Performance is close to statistical significance and shows promise, but does not yet meet the $p < 0.05$ threshold for robust edge confirmation. Collect 20-30 more trades to improve statistical power and re-test.

Quick Reference:

Score: 100/100 (A)

Win Rate: 57.8%

Profit Factor: 1.51

Max Drawdown: 3.9%

Statistical Test (p-value): 0.066

What the p-value means: The permutation test flips trade signs to model a strategy with no edge. The p-value is the proportion of these null simulations whose average outcome is at least as extreme as the observed. A small p (e.g., < 0.05) suggests results unlikely by chance; a large p indicates performance could be random and requires more data. Monte Carlo resampling provides a complementary view of variability across trade sequences.

This page provides a high-level assessment. See detailed sections for full analysis and methodology.

Data Quality & Risk Warnings

No data quality or risk warnings were triggered for this report.

SAMPLE REPORT

Executive Summary

Trading Period: 224 days
Total Trades Executed: 90
Winning Trades (Net): 52 (57.78%)
Winning Trades (Profit/pre-fees): 52 (57.78%)
Losing Trades: 38
Breakeven Trades: 0 (0.00%)

- Account-Level ROI (Broker Equity): 13.86%
- Strategy ROI (Trade P&L; ÷ Avg Capital): 13.25%

- Account Max Drawdown: 3.87% (broker-level)
- Strategy Max Drawdown: 79.03% (signal-level)

Performance Metrics:

- Net Profit: \$138.60
- Gross Profit (pre-fees): \$442.00
- Gross Loss (pre-fees): -\$292.00
- Profit Factor (pre-fees): 1.51
- Fees (commission+swap): -\$6.60
- Dividends/Credits: +\$0.00

Trade Statistics:

- Average Trade: \$1.54
- Average Winner: \$8.50
- Average Loser: \$-7.68
- Best Trade: \$9.00
- Worst Trade: \$-9.00

Capital Deployment:

- Starting Capital: \$1,000.00
- Final Capital (trades only): \$1,138.60
- Broker Final Balance: \$1,138.60

Note: Final Capital shows trading results only (starting + net P&L;). Broker Final Balance includes post-trade deposits/withdrawals and dividends.

Profit vs Loss (incl. Fees & Dividends)

Long Wins 27 trades \$227.10	Long Losses 18 trades \$-141.80
Short Wins 25 trades \$209.90	Short Losses 20 trades \$-156.60

Sharpe (trade) 1.40	Sharpe (daily) 2.51	Profit Factor (net) 1.51	Profit Factor (pre-fees) 1.51
Trades / Week 2.8	Avg Hold (min) 281	Max Drawdown 3.9%	

Note: Some MT5 exports count break-even trades as wins; slight variations in counts and percentages may appear.

Permutation test (mean P&L): $p = 0.066$ ($n=1000$) — marginally significant

System Assessment

Trading system demonstrates strong profit factor (1.51) with positive win rate (57.8%). Positive returns achieved.

Insights & Recommendations

AI-powered analysis identifies patterns and suggests system improvements based on statistical characteristics of your trading data.

Key Observations

- Trading system shows balanced characteristics

Overall System Assessment

System demonstrates consistent profitability with acceptable risk parameters

Actionable Recommendations

- Consider widening profit targets to improve win/loss ratio

Important Disclaimer:

This analysis is provided for educational and informational purposes only. It does not constitute trading advice. Past performance is not indicative of future results. All trading involves substantial risk of loss. You should conduct your own research and develop a trading plan appropriate for your risk tolerance and objectives.

Strategy Assessment

Overall Score: 100/100 — A

✓ Statistically robust. This edge shows real promise across multiple dimensions.

This analysis tests whether your edge is real. MT5 tells you what happened. We tell you whether your results prove a sustainable edge.

Score Breakdown

Metric	Points	Assessment
Win Rate	+15	Good win rate (50-60%) (57.78)
Profit Factor	+15	Strong profit factor (≥ 1.5) (1.51)
Sharpe	+10	Good Sharpe ratio (1.0-1.5) (1.40)
Drawdown	+15	Minimal drawdown ($\leq 5\%$) (0.04)
Expectancy	+0	Minimal positive expectancy (0.15)
Risk Reward	+0	Breakeven risk/reward (1.0-1.5) (1.11)
Consecutive Losses	+5	Short loss streaks (≤ 2 consecutive) (0)

Improvement Suggestions

1. Strategy shows strong performance. Focus on maintaining consistency and avoiding overconfidence bias during winning streaks.

Your strategy demonstrates exceptional quality with strong metrics across all dimensions. Focus on maintaining consistency.

Market Regime Analysis

Your strategy's performance varies significantly across different market conditions. This analysis breaks down results by market volatility regime: Calm (low volatility), Normal (moderate volatility), and Turbulent (high volatility).

Summary:

Strategy performs best in Calm markets (73.3% win rate) and weakest in Turbulent markets (43.3% win rate).

Regime	Trades	Win %	Avg Trade	Profit Factor
Calm	30	73.3%	\$4.14	3.01
Normal	30	56.7%	\$1.35	1.40
Turbulent	30	43.3%	\$-0.87	0.81

Regimes: Low vol (≤ 33 rd percentile) = Calm, 33-67th = Normal, High vol (≥ 67 th) = Turbulent

Win/Loss Analysis

Understanding the relationship between winning and losing trades is critical for evaluating trading system effectiveness and edge validation.

Metric	Value	Interpretation
Gross Profit (net)	\$442.00	Total from all winning trades after fees
Gross Loss (net)	-\$292.00	Total from all losing trades after fees
Average Win	\$8.50	Mean profit per winning trade
Average Loss	\$7.68	Mean loss per losing trade
Largest Win	\$9.00	Best single trade result
Largest Loss	\$-9.00	Worst single trade result
Win/Loss Ratio	1.11	Average win ÷ average loss
Profit Factor	1.51	Gross profit ÷ gross loss

Solid positive expectancy - system maintains edge

Risk-Adjusted Performance

Risk-adjusted metrics normalize returns by volatility, enabling comparison across different trading systems and timeframes.

Metric	Value	Interpretation
Sharpe Ratio	1.40	Excellent (>2), Good (>1), Poor (<0.5)
Sortino Ratio	15.94	Focuses only on downside volatility

Calmar Ratio	6.09	Return per unit of maximum drawdown
Annualized Return	14.91%	Expected annual return at current pace
Annualized Volatility	7.81%	Standard deviation of returns

SAMPLE REPORT

Equity Curve

The equity curve shows account balance progression over time, revealing consistency and drawdown patterns.

Account Summary:

- Starting Equity: \$1,000.00
- Final Equity: \$1,138.60
- Total Return: 13.86%
- Peak Equity: \$1,138.60
- Valley Equity: \$985.80

Drawdown Analysis

Drawdown analysis reveals the magnitude and duration of equity declines from peak values, critical for risk management and psychological preparedness.

Metric	Value	Interpretation
Maximum Drawdown	3.87%	Largest peak-to-trough decline
Current Drawdown	0.00%	Current distance from peak
Longest DD Duration	11 trades	Time to recover from worst drawdown
Average Drawdown	1.52%	Typical decline magnitude

Return Distribution Analysis

Distribution Characteristics:

- Skewness: -0.31
- Kurtosis: -1.88

Near-normal distribution of returns

Time-Based Performance Analysis

Identifying optimal trading times can improve edge by focusing on periods with better execution quality and market conditions.

Optimal Trading Times:

- Best Hour: 10:00
- Best Day: Monday

Deposits & Withdrawals

Date	Type	Amount
2024.11.01 00:00:00	Deposit	\$+1,000.00

All deposits occurred before trading began. Monthly returns reflect pure trading performance.

Monthly Performance

Month	Trades	Total P&L	Monthly Return %	Avg P&L	Win Rate %
2024-11	10	-\$14.20	-1.42%	\$-1.42	40.0%
2024-12	12	\$36.60	+3.71%	\$3.05	66.7%
2025-01	12	\$19.80	+1.94%	\$1.65	58.3%
2025-02	12	-\$14.90	-1.43%	\$-1.24	41.7%
2025-03	12	\$36.60	+3.56%	\$3.05	66.7%
2025-04	12	\$3.10	+0.29%	\$0.26	50.0%
2025-05	12	\$36.80	+3.45%	\$3.07	66.7%
2025-06	8	\$34.80	+3.15%	\$4.35	75.0%
Total	90	\$138.60	+13.86%	\$17.32	57.8%

Monthly breakdown shows performance consistency and seasonal patterns. Monthly Return % calculated from starting balance compounded month-to-month.

Robustness & Fragility

Baseline (no stress): Expectancy \$1.54 per trade, Max Drawdown 3.9%, Total P&L; \$138.60

Trade Removal Stress Test

Removal	Median Expectancy	% Negative Expectancy	Median Max DD	% DD > 30%	Median Total P&L
10%	\$1.57	0.0%	3.9%	0.0%	\$126.80
20%	\$1.57	0.0%	3.9%	0.0%	\$113.20
30%	\$1.53	0.5%	3.9%	0.0%	\$96.20

Interpretation: 10%: ✓ Pass – Robust to random trade removal | 20%: ✓ Pass – Robust to random trade removal | 30%: ✓ Pass – Robust to random trade removal

Cost & Slippage Sensitivity

Fee Increase Scenarios

Scenario	Expectancy	Max DD	Total P&L
+25% fees	\$1.51	3.9%	\$135.75
+50% fees	\$1.48	3.9%	\$132.90

Interpretation: +25% fees: ✓ Survives fee increase | +50% fees: ✓ Survives fee increase

Adverse Slippage Scenarios (PnL haircut model)

Scenario	Expectancy	Max DD	Total P&L
2% PnL haircut	\$1.38	4.0%	\$123.89
5% PnL haircut	\$1.13	4.2%	\$101.83

Interpretation: 2% PnL haircut: ✓ Tolerates slippage | 5% PnL haircut: ✓ Tolerates slippage

Best & Worst Trades

Top 5 Winning Trades

Symbol	Side	Close Date	P&L
NAS100	LONG	2024-11-05	\$9.00
NAS100	SHORT	2024-11-17	\$9.00
NAS100	LONG	2024-12-01	\$9.00
NAS100	LONG	2024-12-04	\$9.00
NAS100	SHORT	2024-12-11	\$9.00

Top 5 Losing Trades

Symbol	Side	Close Date	P&L
NAS100	SHORT	2024-11-22	\$-9.00
NAS100	LONG	2025-01-01	\$-9.00
XAUUSD	LONG	2025-02-15	\$-9.00
EURUSD	LONG	2025-04-08	\$-9.00
XAUUSD	LONG	2025-02-02	\$-8.70

Review your best trades to identify repeatable patterns. Analyze worst trades to avoid costly mistakes.

Symbol Performance Analysis

Performance breakdown across 3 traded symbols. Identifies which instruments provide the most consistent edge.

Symbol	Trades	Win Rate	Total P&L	Avg P&L	Long P&L	Short P&L
EURUSD	30	63.3%	\$74.20	\$2.47	\$44.10	\$30.10
XAUUSD	30	56.7%	\$41.20	\$1.37	\$12.10	\$29.10
NAS100	30	53.3%	\$23.20	\$0.77	\$29.10	\$-5.90

Holding Period Analysis

Holding Period Statistics:

- Average: 281.3 minutes
- Median: 270.0 minutes
- Range: 60.0 - 480.0 minutes

Trade Classification:

- Scalp Trades (<15 min): 0 trades, \$0.00
- Intraday (15min-24hr): 90 trades, \$138.60
- Swing (>24hr): 0 trades, \$0.00

Duration vs Outcome

Time-in-trade vs performance:

- Overall median hold: 270.0 minutes
- Best P&L; bucket: Intraday (1-4h)
- Best win-rate bucket: Intraday (1-4h)

Bucket	Trades	Win Rate	Avg P&L	Total P&L
Scalp (<15m)	0	0.0%	\$0.00	\$0.00
Quick intraday (15-60m)	0	0.0%	\$0.00	\$0.00
Intraday (1-4h)	32	68.8%	\$3.18	\$101.90
Intraday (4-24h)	58	51.7%	\$0.63	\$36.70
Swing (1-3d)	0	0.0%	\$0.00	\$0.00
Swing (3-7d)	0	0.0%	\$0.00	\$0.00
Position (7d+)	0	0.0%	\$0.00	\$0.00

R/R Execution Quality

- Trades with stops: 45 (with take profit: 45)
- Avg planned R/R: 1.00x | Median: 1.00x
- Avg realized R/R: 0.10x | Median: 0.10x
- 25th-75th pct realized: 0.10x – 0.10x
- Hit rate vs plan (realized $\geq$ planned): 0.0%
- Avg R/R slippage (realized - planned): -0.90x

- Avg risk per trade: 1.00% of entry price

Position Sizing Analysis

Position Size Statistics:

- Average: 0.1000 lots
- Median: 0.1000 lots
- Range: 0.1000 - 0.1000 lots
- Consistency Score: 100.0%

Consistent position sizing reduces variance and improves statistical reliability of results.

Monte Carlo Simulation

Monte Carlo simulation resamples historical trades 1,000 times to project range of possible outcomes, revealing system robustness.

Scenario	Account Balance	Probability
5th Percentile (Pessimistic)	\$1,009.88	5%
25th Percentile	\$1,088.57	25%
Median Outcome	\$1,138.90	50%
75th Percentile	\$1,190.58	75%
95th Percentile (Optimistic)	\$1,266.32	95%

Permutation & Bootstrap p-values:

- Final Equity (bootstrap p-value): 0.50 (50.2%)
- Final Equity (permutation - order-invariant): 1.00 (100.0%)
- Bootstrap SE (final equity p-value): 0.0158
- Sharpe $\geq$ Observed: 0.85
- Drawdown $\leq$ Observed (milder): 0.38

Null Strategy Comparison:

- Null median final equity: \$1001.35
- Null probability of profit: 50.2%

Interpretation: High probability of profitability based on historical edge

Bootstrap p-value around 0.40-0.60 is normal and expected—it measures sampling uncertainty (if you collected another set of trades, would results be similar?), not edge quality. For edge validation, see the Permutation Test section which tests if results beat randomness (target: $p < 0.05$).

Edge Validation Summary:

Observed final equity: \$1138.60. Permutation p-value for final equity = 0.50.

Simulation seed: 42 (for reproducibility)

Trader Action Plan

Summary: Next steps: 0 critical items, 2 high priority, 1 medium priority

■ HIGH PRIORITY

Focus capital on EURUSD

Why: EURUSD contributes 53.5% of P&L.; This is your edge.

Impact: Concentrate capital on proven winner

Log 50+ more trades before major changes

Why: Current sample: 90 trades. Approaching statistical relevance.

Impact: Build confidence in edge stability

■ MEDIUM PRIORITY

Review take profit targets

Why: 0% of trades hit planned R/R. Targets may be unrealistic.

Impact: Improve hit rate; reduce over-optimization

How to Use This Plan:

1. Address all CRITICAL items first—they directly threaten profitability
2. HIGH priority items improve your edge; implement within 1-2 weeks
3. MEDIUM priority items fine-tune performance; deploy after core items
4. After each major change, collect 20+ new trades before evaluating impact

Glossary of Terms

Profit Factor

Ratio of gross profit to gross loss. Values > 1.0 indicate profitability; > 1.5 is good; > 2.0 is excellent.

Win Rate

Percentage of trades that were profitable. Not a standalone indicator of success—must be combined with risk/reward ratio.

Sharpe Ratio

Risk-adjusted return metric. Measures excess return per unit of volatility. > 1.0 is good; > 2.0 is excellent; > 3.0 is exceptional.

Sortino Ratio

Like Sharpe but only penalizes downside volatility. Better for strategies with asymmetric returns. > 1.5 is good.

Calmar Ratio

Return divided by maximum drawdown. Measures reward relative to worst loss. > 1.0 is acceptable; > 3.0 is strong.

Maximum Drawdown

Largest peak-to-trough decline in account equity. Critical risk metric. < 20% is conservative; < 30% moderate; > 50% is high-risk.

Expectancy

Average amount you can expect to win (or lose) per trade. Positive expectancy is required for long-term profitability.

Final Equity (bootstrap p-value)

Probability that resampled trades (with replacement) produce final equity as high as observed. Tests if your ending balance could occur by sampling randomness. Values near 0.50 suggest results are typical; near 0.0 or 1.0 suggest extreme outcomes.

Final Equity (permutation p-value)

Probability that randomly reordering your trades produces final equity as high as observed. Often near 1.0 because trade order doesn't change total P&L.; Focus on bootstrap p-value for final equity assessment.

Bootstrap SE (Standard Error)

Uncertainty estimate for bootstrap p-values. Smaller values (< 0.02) indicate more reliable p-value estimates. Based on number of bootstrap iterations.

Permutation Test

Statistical test that randomly shuffles trade order thousands of times to test if observed metrics (Sharpe, drawdown) are unusual. p-value < 0.05 suggests results are statistically significant.

Monte Carlo Simulation

Statistical technique that models thousands of possible outcomes by randomizing trade sequences. Shows probability ranges and confidence bands for future performance.

Null Strategy

Benchmark that randomly assigns win/loss to observed trade sizes. Tests if your edge beats random entries. If your results beat null strategy < 50% of the time, your edge may be weak.

p-value

Probability of observing results as extreme as yours if no real edge exists. Lower is better: < 0.05 is significant; < 0.01 is strong; < 0.001 is very strong.

Bootstrap Resampling

Statistical method that creates thousands of simulated datasets by sampling your trades with replacement. Estimates uncertainty and confidence intervals without assumptions about data distribution.

R-Multiple

Trade profit/loss expressed as multiples of initial risk (distance to stop loss). A +2R trade means you made twice your initial risk; -1R means you hit your stop loss.

Risk/Reward Ratio

Ratio of intended profit target to stop loss distance. Common targets: 1:2 (risk \$1 to make \$2), 1:3, etc. Higher ratios allow profitable trading with lower win rates.

Time-Weighted Return (TWR)

Compounds per-trade returns to show total portfolio growth. Accounts for changing account size. More accurate than simple P&L; / starting capital for performance measurement.

Profit Factor (Pre-fees)

Ratio before commissions/swaps. Shows gross edge before costs. Compare with net profit factor to assess fee impact. Large difference indicates cost sensitivity.

Market Regime

Classification of market conditions (Calm/Normal/Turbulent) based on volatility. Performance varies by regime—profitable strategies often favor specific regimes.

Strategy Score

Composite rating (0-100) evaluating multiple dimensions: profitability, consistency, risk management, execution quality. Transparent breakdown shows which areas need improvement.

Trade Removal Stress Test

Randomly removes 10-30% of trades and recalculates metrics. Tests if your edge depends on a few lucky trades. Robust strategies maintain positive expectancy even after random removals.

Cost Sensitivity

How performance degrades when fees increase by +25% or +50%. Tests real-world survivability as brokers vary commission structures. Strong edges remain profitable despite higher costs.

Slippage

Difference between intended execution price and actual fill price. Modeled here as percentage haircut on trade P&L.; Tests if your edge survives adverse execution in fast markets.

Duration vs Outcome

Performance breakdown by time-in-trade (scalp, intraday, swing, position). Identifies optimal holding periods. Scalp trades often lose to fees; intraday/swing may be more profitable.

Execution Quality (R/R)

Compares planned risk/reward to actual achieved R/R. Hit ratio vs plan shows how often you achieve targets. Low hit ratio suggests unrealistic take-profit levels.

Sample Size

Number of trades analyzed. Statistical confidence requires: 30+ trades minimum; 100+ preferred; 300+ for high confidence. Fewer trades = higher luck factor.
